## Motivation and Methods

- ✓ Research on magnetic materials for potential applications in spin-based electronics is one of the most active fields of current study in both academia and industry.
- ✓ High degree of spin polarization in electron transport – wanted in spintronics.
- ✓ Spintronics – an emerging technology utilizing a spin degree of freedom in electronic devices.
- ✓ There are various mechanisms which could potentially alter the degree of transport spin polarization, such as mechanical strain, structural disorder, temperature, termination surface/interface in thin film multilayer geometry, etc.
- ✓ The main purpose of this work is to investigate effect of atomic disorder on magnetic properties of MnCrVAl, a material which recently attracted attention as a potential spin-gapless semiconductor.
- ✓ Spin-gapless semiconductors are recently discovered materials which are characterized by a zero band gap in one spin channel and by a finite band gap in the other channel.
- ✓ Here, we employ density functional calculations to explore effect of atomic disorder on magnetic properties of Heusler compound, MnCrVAl.
- ✓ Vienna Ab Initio Simulation Package (VASP).
- ✓ Computations performed at the Department of Physics computing facilities (20-node Beowulf cluster), UNI.

## Crystal and electronic structure of MnCrVAl

## Atomic disorder

Various crystal structures of disordered MnCrVAl.

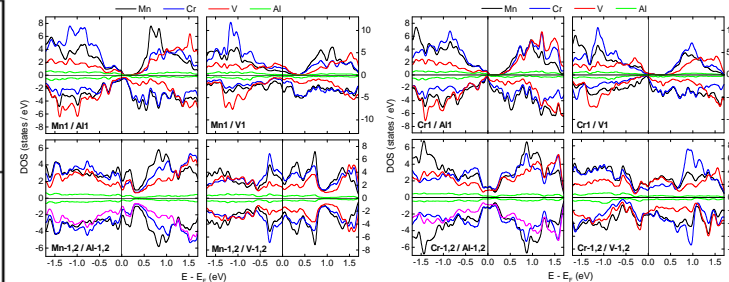

## Calculated magnetic moments

	Lattice (a/b/c)	Mn1	Mn2,3,4	Cr1	Cr2,3,4	V1	V2,3,4	Al1	Al2,3,4	Total
Ideal	5.90/5.90/5.90	1.776	1.776	2.077	2.077	-0.943	-0.943	-0.007	-0.007	11.610

Calculated magnetic moments (in units of  $\mu_B$ ) and lattice constant (in Å) of MnCrVAl in ordered and disordered states.

- ✓ In completely ordered structure, MnCrVAl exhibits net magnetic moment of  $\approx 3.0 \mu_B/\text{f.u.}$
- ✓ Recent experimental work showed that MnCrVAl samples demonstrate close to zero net magnetization.
- ✓ XRD measurements indicated a significant degree of atomic disorder in the samples
- ✓ Magnetization quenching is induced by atomic disorder.

## Electronic structure

- ✓ Spin- and atom- resolved densities of states (DOS).
- ✓ Spin-flip transition if 25% Mn/Cr atoms interchanged with V/Al.
- ✓ Paramagnetic transition if 50% Mn/Cr atoms interchanged with V/Al.
- ✓ Cr1-Al1 disorder results in nearly half-metallic transition.
- ✓ Paramagnetic transition accompanied by tetragonal distortion.

## Summary

- ✓ We analyzed physical mechanism of magnetization reduction in MnCrVAl: potential spin-gapless semiconductor.
- ✓ Various atomic disorder schemes are studied.
- ✓ Depending on the degree of disorder, exchanging of atomic positions between Mn / Cr with V / Al results in either reduced total magnetization due to spin flip, or in ferrimagnetic – paramagnetic transition.
- ✓ In certain disordered structures the spin polarization of MnCrVAl significantly increases, almost reaching the half-metallic state.
- ✓ Exchange of atomic positions of Mn with Cr, and V with Al has no significant effect on electronic and magnetic properties of MnCrVAl.
- ✓ These findings may have important contribution to understanding the role of atomic disorder on magnetic properties of materials with potential applications in spin-based electronics.
